Location: Novosibirsk, Russia - open to remote / international B2B contract discussions

Profile

Architecture and engineering delivery leader who turns ambiguous product initiatives into clear architecture, ownership, delivery gates, production readiness, and business-visible execution.

I combine CTO / Director of Engineering experience with hands-on architecture governance, product intake, delivery transparency, quality gates, mixed-team execution, high-load platforms, and practical AI/data workflow work. My strongest fit for Infatica.io is helping the CTO and owners evaluate product ideas, shape technical direction, define delivery boundaries, manage in-house/vendor execution, and make launch cost, risk, dependencies, and readiness visible before teams commit to build.

Best Match For Infatica.io

- Led architecture and delivery governance for a 200+ person distributed engineering organization with 14 team leads and multiple product, QA, DevOps, and platform streams.
- Built owner-visible delivery systems: roadmap / portfolio management, release governance, acceptance criteria, quality gates, production-readiness checks, and executive reporting.
- Scaled and governed a high-load delivery/e-commerce platform from 3K to 300K DAU and from 100 to 100K+ delivery orders per day, with peaks of 130K.
- Built and governed transactional, API-heavy and data-heavy platform workflows handling 1M+ financial transactions per day across payments, commissions, payouts, subscriptions, recurring payments, and BNPL.
- Led mixed internal/external delivery, including vendor capacity, cross-team dependencies, technical debt, production stability, cloud cost optimization, and risk ownership.
- Designed AI-assisted and agentic delivery workflows with explicit specs, gates, traceability, validators, handoff standards, and controlled implementation.
- Domain bridge: my direct background is high-load platforms, integrations, AI/data workflows, production governance, and architecture gates; proxy/scraping/browser automation is an adjacent domain where I would go deep quickly rather than overclaim prior specialization.

Experience

CTO & Co-founder - Fincomtech

Moscow / Remote | Sep 2023 - Present

Co-founded and built a fintech platform from product vision to pilots and first customers.

- Built the company's initial product and engineering direction from scratch: product vision, first engineering team, architecture, delivery model, and initial operating rhythm.
- Worked directly with founders, first customers, and enterprise stakeholders to translate commercial demand into roadmap, architecture, pilot scope, and implementation model.
- Designed the first platform architecture, cloud infrastructure, and baseline DevOps processes.
- Built delivery governance around prioritization, sprint cadence, release control, and practical execution.
- Connected product goals, technical feasibility, delivery capacity, and commercial constraints into a workable implementation plan.

AI-Native SDLC Advisor - Setronica

Remote | Feb 2026 - Present

Advising on controlled AI-assisted software delivery and specification-driven development.

- Designed an AI-native delivery model with explicit task artifacts, context handling, agent roles, guardrails, validators, diff discipline, and traceability.
- Focused on specification quality, readiness gates, implementation evidence, handoff standards, and learning loops.

Founder / Chief AI Architect - AI Studio / AI Product Portfolio

Remote | Sep 2025 - Present

Building AI-native product concepts and implementation foundations in workflow-heavy domains.

- Built AI-assisted product and engineering workflows using Codex, Claude Code, Cursor/Kiro-style agentic development, Python, FastAPI, PostgreSQL, Redis, and LLM orchestration.
- Designed workflows that turn raw inputs into structured understanding, decisions, tasks, memory, follow-ups, and reviewable artifacts.
- Used artifact-first delivery: source-to-understanding, specification, implementation gates, validators, traceability, and review discipline.

Deputy CTO / Director of Engineering - Arameem / ToYou

Cyprus / Distributed | Oct 2018 - Aug 2025

Scaled and governed a high-load delivery/e-commerce platform and distributed engineering organization.

- Led a distributed technology organization of 200+ people across engineering, QA, DevOps, and product delivery; managed 14 team leads and functional heads.
- Scaled the platform from 3K to 300K DAU and from 100 to 100K+ delivery orders per day, with peaks of 130K.
- Governed a transactional architecture handling 1M+ financial transactions per day across payments, commissions, payouts, subscriptions, recurring payments, and BNPL.
- Built portfolio and roadmap visibility for business and product stakeholders, balancing growth work, technical debt, production stability, and cross-team dependencies.
- Led mixed internal/external delivery and recovered critical delivery capacity after sudden vendor/team disruption.
- Introduced release governance, CI/CD quality gates, unit testing, SonarQube-based controls, code review discipline, and measurable engineering standards.
- Reduced critical production defects through systematic testing, ownership clarity, and delivery governance.
- Cut cloud infrastructure costs by more than 50% while supporting business growth.
- Led production GenAI / LLM support automation with internal APIs, workflow integration, quality controls, and human escalation.

Earlier Leadership Experience

2010 - 2018 | Novosibirsk / Remote

- CEO & Key Shareholder, Sobit: operated and stabilized a software company; managed sales, finance, project portfolio, distributed teams, solution architecture, and delivery governance.
- Director of IT Department, CDEK: modernized and stabilized a critical logistics platform after years of technical debt; improved performance by 50%+ and reduced outages through architecture and ownership changes.
- Director of Software Development, CFT: led a 60+ engineering department delivering core-banking systems and enterprise implementations for major financial institutions; built a recurring support revenue model exceeding \$10M annually.

Selected Skills

Architecture governance, engineering delivery leadership, product intake, feasibility assessment, MVP planning, production readiness, delivery transparency, CTO support, owner-facing reporting, stakeholder management, mixed internal/vendor delivery, technical debt management, acceptance criteria, code review process, task handoff standards, CI/CD quality gates, SonarQube, unit testing, observability, release governance,

high-load platforms, API integrations, transactional systems, cloud cost optimization, AI-assisted SDLC, LLM workflows, RAG/data workflows, human-in-the-loop controls.

Technology

Python for prototypes and automation, FastAPI, PostgreSQL, Redis, SQLAlchemy, Pydantic, Celery, Docker, Kubernetes, AWS, GitLab CI/CD, SonarQube, OpenAI API, local/open models, LLM orchestration, RAG/knowledge-base workflows, API integrations, Java/Spring background, SQL, cloud infrastructure foundations, observability concepts, Playwright/browser-automation concepts at architecture-evaluation level.

Education

BSc in Physics, Novosibirsk State University, 1994-1999
