Location: Novosibirsk, Russia - open to remote / international B2B contract discussions

Profile

Product operations and AI automation leader who builds the operating systems that help product, engineering, design, analytics, and business teams make better decisions faster.

I combine CTO / Director of Engineering experience with practical AI automation: product and delivery governance, cross-team processes, roadmap and portfolio visibility, metrics, AI-assisted workflows, adoption, and quality controls. My strongest fit for Fundraise Up is building repeatable product-operating processes and AI-enabled workflows that reduce coordination noise, improve decision quality, and scale across teams without becoming bureaucracy.

Best Match For Fundraise Up

- Built cross-team operating models for product and engineering organizations: prioritization, delivery rhythm, release control, portfolio visibility, quality gates, ownership, and executive reporting.
- Led AI automation in production and designed AI-native workflows that turn messy human inputs into structured context, decisions, tasks, and reusable processes.
- Managed large distributed organizations and leadership layers, while keeping hands-on enough to design process artifacts, metrics, tools, and adoption paths.
- Worked directly with founders, customers, product leaders, engineering leaders, and enterprise stakeholders to translate ambiguity into clear roadmap, scope, ownership, and measurable outcomes.
- Fluent in Russian and English; comfortable operating in mixed-language distributed teams and writing English documentation.

Relevant Product Operations And Automation Evidence

Product / Engineering Operating Model

- Built delivery governance for a 200+ person distributed technology organization with 14 team leads and functional heads.
- Introduced portfolio visibility, prioritization discipline, release governance, ownership clarity, quality gates, and structured communication between product, engineering, QA, DevOps, and business teams.

- Managed competing roadmap, production, integration, technical debt, and growth priorities in a high-load platform environment.
- Reduced coordination risk by making priorities, ownership, delivery status, quality signals, and release readiness explicit.

AI Automation For Operational Workflows

- Led production GenAI / LLM support automation with internal APIs, business workflow integration, quality controls, human escalation, and measurable operational impact.
- Designed AI-native workflows where unstructured inputs become structured facts, tasks, decisions, memory, and reusable operating processes.
- Built and advised on AI-assisted delivery processes using task artifacts, context management, agent roles, validators, gates, traceability, and review discipline.
- Focused on adoption and control: AI should make teams faster and clearer, not create unmanaged automation debt.

Metrics, Quality, And Scalable Execution

- Introduced CI/CD quality gates, unit testing, SonarQube-based controls, release discipline, and measurable quality indicators.
- Reduced production defects and manual QA effort through standards, test strategy, and ownership clarity.
- Cut cloud infrastructure costs by more than 50% while supporting business and feature growth.
- Built executive-level reporting and stakeholder alignment around roadmap, delivery, risk, capacity, and operational improvements.

Experience

CTO & Co-founder - Fincomtech

Moscow / Remote | Sep 2023 - Present

Co-founded and built a fintech platform from product vision to pilots and first customers.

- Built the initial product and engineering operating model: product vision, first engineering team, prioritization, sprint rhythm, release control, and delivery governance.
- Worked directly with first customers and enterprise presales to translate commercial demand into roadmap, architecture, pilot scope, and implementation model.
- Connected product goals, technical feasibility, delivery capacity, and commercial constraints into a practical execution plan.
- Designed the first platform architecture, cloud infrastructure, and baseline DevOps process.
- Helped move the product from concept to pilot implementations with first customers.

AI-Native SDLC Advisor - Setronica

Remote | Feb 2026 - Present

Advising on controlled AI-assisted software delivery and specification-driven development.

- Designed an AI-native delivery model with explicit task artifacts, context handling, agent roles, guardrails, validators, diff discipline, and traceability.
- Helped shape AI-assisted development as a repeatable team workflow rather than individual prompt usage.
- Focused on adoption mechanics: how to make AI help teams specify, build, review, and ship with better control.

Founder / Chief AI Architect - AI Studio / AI Product Portfolio

Remote | Sep 2025 - Present

Building AI-native product concepts and implementation foundations in workflow-heavy domains.

- Built AI-assisted product and engineering workflows using Codex, Claude Code, Cursor/Kiro-style agentic development, Python, FastAPI, PostgreSQL, Redis, and LLM orchestration.
- Designed workflows that turn raw inputs into structured understanding, decisions, tasks, memory, follow-ups, and reviewable artifacts.
- Created AI decision-support contours such as virtual CFO / multi-agent board workflows for financial model review, risk analysis, and strategic decision structuring.
- Used artifact-first delivery: source-to-understanding, specification, implementation gates, validators, traceability, and review discipline.

Deputy CTO / Director of Engineering - Arameem / ToYou

Cyprus / Distributed | Oct 2018 - Aug 2025

Scaled and governed a high-load delivery/e-commerce platform and distributed engineering organization.

- Led a distributed technology organization of 200+ people across engineering, QA, DevOps, and product delivery.
- Managed 14 team leads and functional heads, building leadership structure, delivery governance, and ownership clarity.
- Scaled the platform from 3K to 300K DAU and from 100 to 100K+ delivery orders per day, with peaks of 130K.
- Built portfolio and roadmap visibility for business and product stakeholders, balancing growth work, technical debt, production stability, and cross-team dependencies.
- Led production GenAI / LLM customer-support automation with internal APIs, workflow integration, quality controls, and human escalation.

- Introduced release governance, CI/CD quality gates, unit testing, SonarQube-based quality controls, and measurable engineering standards.
- Reduced critical production defects through systematic testing, ownership clarity, and delivery governance.
- Restored delivery capability after sudden loss of an outsourcing partner and 30+ people across QA, ERP, and CRM; rebuilt the team in about 1.5 months and kept critical delivery running.
- Cut cloud infrastructure costs by more than 50% while supporting business growth.

Earlier Leadership Experience

2010 - 2018 | Novosibirsk / Remote

- CEO & Key Shareholder, Sobit: operated and stabilized a software company through commercial uncertainty; managed sales, finance, project portfolio, distributed teams, client communication, and delivery governance.
- Director of IT Department, CDEK: modernized and stabilized a critical logistics platform after years of technical debt; improved performance by 50%+ and reduced outages through architecture and ownership changes.
- Director of Software Development, CFT: led a 60+ engineering department delivering core-banking systems and enterprise implementations for major financial institutions; built a recurring support revenue model exceeding \$10M annually.

Selected Skills

Product operations, product and engineering operating model, AI workflow automation, product delivery governance, roadmap and portfolio management, prioritization frameworks, metrics and KPI tracking, quarterly planning, process design, adoption management, cross-functional alignment, stakeholder communication, executive reporting, AI-native SDLC, LLM orchestration, AI agents, human-in-the-loop workflows, quality gates, release governance, CI/CD, observability, cost optimization, distributed team leadership, product strategy, technical fluency.

Technology

AI-assisted workflows with Codex, Claude Code, Cursor/Kiro-style tools, Python for prototypes and automation, FastAPI, PostgreSQL, Redis, SQLAlchemy, Pydantic, Celery, Docker, Kubernetes, AWS, GitLab CI/CD, SonarQube, OpenAI API, local/open models, RAG/knowledge-base workflows, Java/Spring background, SQL, cloud infrastructure foundations.

Education

BSc in Physics, Novosibirsk State University, 1994-1999

Languages

English - C1

Russian - Native
