Website: <https://vladimirrezin.ru/>

Location: Novosibirsk, Russia - open to remote / international B2B contract discussions

Profile

AI transformation and automation leader who turns business processes into practical AI workflows, internal assistants, knowledge bots, copilots, and governed automation systems.

I combine CTO-level engineering leadership with hands-on AI/product building: discovery, process analysis, architecture, integrations, LLM workflows, human-in-the-loop controls, adoption, metrics, and delivery governance. My strongest fit for GoMining is helping founders and department heads identify high-ROI AI opportunities, turn them into implementable roadmaps, launch internal AI systems, and scale adoption across the company without creating operational chaos.

Best Match For GoMining

- Built and governed production GenAI / LLM automation in a high-load business environment, with internal APIs, workflow integration, quality controls, human escalation, and measurable business impact.
- Designed AI-native delivery and SDLC processes where tasks, context, specifications, validators, quality gates, agent roles, and traceability work as one controlled operating model.
- Led cross-functional engineering and product execution at scale: 200+ people, 14 team leads, high-load platform growth, portfolio governance, and executive stakeholder alignment.
- Built products and platforms from zero to pilot and first customers, translating business goals into architecture, delivery plans, teams, and measurable outcomes.
- Comfortable working as a playing coach: strategic enough for transformation roadmap and leadership alignment, practical enough to shape architecture, integrations, prompts, automation flows, and rollout discipline.

Relevant AI And Automation Evidence

Production GenAI Support Automation

- Led production GenAI / LLM customer-support automation for a high-load delivery and e-commerce platform.

- Designed the workflow around LLM orchestration, internal APIs, business tools, quality controls, human escalation, and measurable operational impact.
- Reduced manual support load by routing a large share of requests through AI while keeping sensitive or uncertain cases escalated to people.
- Public result wording: measurable six-figure quarterly savings.

AI-Native SDLC And Agentic Delivery

- Designed an AI-native SDLC model with explicit task artifacts, context handling, agent roles, guardrails, validators, diff discipline, and traceability.
- Applied this model to AI-assisted product and software delivery using Codex, Claude Code, Cursor/Kiro-style workflows, Python automation, FastAPI, PostgreSQL, Redis, and LLM orchestration.
- Focused on making AI usage repeatable and auditable rather than dependent on individual prompts or ad hoc tool usage.

Internal AI Products And Workflow Automation

- Built and advised on AI workflows that turn unstructured inputs into structured facts, tasks, decisions, memory, and reusable operating processes.
- Designed AI/CRM and voice-note automation concepts where communication, lead context, status changes, and follow-ups become structured CRM data and management analytics.
- Created AI decision-support contours such as virtual CFO / multi-agent board workflows for financial model review, risk analysis, and strategic decision structuring.

Sensitive-Domain AI Architecture

- Initiated MedVoice, an AI/MedTech assistant concept for doctor support: doctor-patient dialogue processing, anamnesis structuring, medical-document drafts, traceability, and mandatory doctor verification.
- Designed Mind & Muscle as a personal post-checkup assistant concept: long document parsing, fact extraction, separation of clinical findings and lifestyle recommendations, action items, reminders, personal context, and Q&A.
- Treat human-in-the-loop verification, source traceability, and explicit uncertainty as core product architecture, not compliance decoration.

Experience

CTO & Co-founder - Fincomtech

Moscow / Remote | Sep 2023 - Present

Co-founded and built a fintech platform from product vision to pilots and first customers.

- Built the company's initial product and engineering direction from scratch: product vision, first engineering team, delivery model, and initial operating rhythm.
- Designed the first platform architecture, cloud infrastructure, and baseline DevOps processes.

- Worked directly with first customers and enterprise presales, translating commercial commitments into realistic roadmap, architecture, and pilot scope.
- Built delivery governance around prioritization, sprint cadence, release control, and practical execution.
- Connected product goals, technical feasibility, and commercial constraints into a workable implementation plan.

AI-Native SDLC Advisor - Setronica

Remote | Feb 2026 - Present

Advising on controlled AI-assisted software delivery and specification-driven development.

- Designed an AI-native delivery model with explicit artifacts, context handling, agent roles, guardrails, validators, diff discipline, and traceability.
- Helped shape AI-assisted development as a governed engineering workflow rather than uncontrolled individual tool usage.

Founder / Chief AI Architect - AI Studio / AI Product Portfolio

Remote | Sep 2025 - Present

Building AI-native product concepts and implementation foundations in workflow-heavy domains.

- Built AI-assisted product and engineering workflows using Codex, Claude Code, Cursor/Kiro-style agentic development, Python, FastAPI, PostgreSQL, Redis, and LLM orchestration.
- Initiated MedVoice as a builder-first AI/MedTech product contour for doctor support, traceability, and human verification.
- Developed Mind & Muscle conceptually and technically as a post-checkup assistant: document intake, fact extraction, action planning, reminders, and contextual Q&A.
- Used artifact-first delivery: source-to-understanding, specification, implementation gates, validators, traceability, and review discipline.

Deputy CTO / Director of Engineering - Arameem / ToYou

Cyprus / Distributed | Oct 2018 - Aug 2025

Scaled and governed a high-load delivery/e-commerce platform and distributed engineering organization.

- Led a distributed technology organization of 200+ people across engineering, QA, DevOps, and product delivery.
- Managed 14 team leads and functional heads, building leadership structure, delivery governance, and ownership clarity.
- Scaled the platform from 3K to 300K DAU and from 100 to 100K+ delivery orders per day, with peaks of 130K.

- Built and governed transactional architecture handling 1M+ financial transactions per day across payments, commissions, payouts, subscriptions, recurring payments, and BNPL.
- Led production GenAI / LLM support automation with internal APIs, workflow integration, quality controls, and human escalation.
- Introduced portfolio visibility, prioritization discipline, release governance, CI/CD quality gates, unit testing, and SonarQube-based quality controls.
- Reduced critical production defects through systematic testing, ownership clarity, and delivery governance.
- Cut cloud infrastructure costs by more than 50% while supporting business growth.

Earlier Leadership Experience

2010 - 2018 | Novosibirsk / Remote

- CEO & Key Shareholder, Sobit: operated and stabilized a software company through commercial uncertainty; managed sales, finance, project portfolio, distributed teams, client communication, and delivery governance.
- Director of IT Department, CDEK: modernized and stabilized a critical logistics platform after years of technical debt; improved performance by 50%+ and reduced outages through architecture and ownership changes.
- Director of Software Development, CFT: led a 60+ engineering department delivering core-banking systems and enterprise implementations for major financial institutions; built a recurring support revenue model exceeding \$10M annually.

Selected Skills

AI transformation strategy, AI opportunity discovery, process analysis, LLM orchestration, workflow automation, AI agents, RAG and knowledge workflows, internal assistants, copilots, human-in-the-loop design, AI-native SDLC, prompt engineering and guardrails, API integrations, enterprise architecture, product roadmap, delivery governance, KPI tracking, adoption management, stakeholder alignment, executive reporting, platform architecture, CI/CD, quality gates, observability, high-load systems, cost optimization.

Technology

Python for prototypes and automation, FastAPI, PostgreSQL, Redis, SQLAlchemy, Pydantic, Celery, Docker, Kubernetes, AWS, GitLab CI/CD, SonarQube, OpenAI API, local/open models, OCR/document-processing concepts, RAG/knowledge-base workflows, Java/Spring background, SQL, cloud infrastructure foundations.

Education

BSc in Physics, Novosibirsk State University, 1994-1999

Languages

English - C1

Russian - Native
