Location: Novosibirsk, Russia - open to remote / hybrid-with-travel discussions

Profile

CTO and AI Product / Solution Architect focused on responsible AI systems, health workflows, production architecture, and engineering teams that turn high-stakes AI concepts into safe, auditable, human-centered products.

I combine hands-on AI/product building with CTO-level engineering leadership: production GenAI adoption, human-in-the-loop workflows, document understanding, traceability, platform architecture, integrations, security/governance, and quality gates. I have led large engineering organizations and high-load platforms, but I am most useful in roles where the CTO is still a builder: shaping the problem, architecture, team, delivery process, risk controls, and measurable outcome.

For Noora Health, the strongest fit is the intersection of my work on production LLM automation, MedTech AI concepts, post-checkup health-document workflows, and engineering systems that stay reliable under real-world constraints.

Most Relevant Evidence For Noora Health

Responsible AI And Health Workflow Thinking

Initiated MedVoice, an AI/MedTech assistant concept for doctor support: doctor-patient dialogue processing, anamnesis structuring, medical-document drafts, clinical reasoning support, traceability, and mandatory doctor verification.

Designed Mind & Muscle, a personal post-checkup assistant concept and implementation foundation: long medical document parsing, OCR, fact extraction, separation of clinical findings and lifestyle recommendations, action items, reminders, personal context, and contextual Q&A.

Treat health AI as support, not replacement: human-in-the-loop verification, source traceability, explicit uncertainty, and guardrails are part of the product architecture, not afterthoughts.

Production GenAI Adoption

Led production GenAI / LLM customer-support automation on a high-load delivery/e-commerce platform.

Designed the system around LLM orchestration, internal APIs, business workflow integration, quality controls, escalation to humans, and measurable operational impact.

Result: a large share of support requests handled by AI with human escalation for sensitive or uncertain cases and measurable six-figure quarterly savings.

Engineering Leadership And Platform Scale

Led a distributed technology organization of 200+ people across engineering, QA, DevOps, and product delivery.

Managed 14 team leads / functional heads while building delivery governance, quality standards, release discipline, and ownership clarity.

Scaled a high-load platform from 3K to 300K DAU and from 100 to 100K+ daily delivery orders, with peaks of 130K.

Built and governed transactional workflows handling 1M+ financial transactions per day across payments, commissions, payouts, subscriptions, recurring payments, and BNPL flows.

Experience

Founder / Chief AI Architect - AI Studio / MedTech AI Portfolio

Remote | Sep 2025 - Present

Building AI-native product concepts and implementation foundations in sensitive workflow domains, with a current focus on MedTech and doctor-facing support.

Initiated MedVoice as a builder-first AI/MedTech product contour for doctor support, not autonomous medical decision-making.

Designed workflows for doctor-patient dialogue processing, anamnesis structuring, medical-document drafts, traceability, and mandatory human verification.

Built AI-assisted product and engineering workflows using Codex, Claude Code, Cursor/Kiro-style agentic development, Python, FastAPI, PostgreSQL, Redis, OCR/document-processing concepts, and LLM orchestration.

Developed Mind & Muscle conceptually and technically as a personal post-checkup assistant: medical document intake, fact extraction, clinical/lifestyle separation, action planning, reminders, and contextual Q&A.

Used an artifact-first AI-native SDLC: source-to-understanding, specification, implementation gates, validators, traceability, and review discipline.

CTO & Co-founder - Fincomtech

Moscow / Remote | Sep 2023 - Present

Co-founded and built a fintech platform from product vision to pilots and first customers.

Defined product development process, prioritization, release control, and initial engineering governance.

Built the first engineering team and delivery rhythm for a new product organization.

Worked directly with first customers and enterprise presales to turn business needs into roadmap, architecture, and pilot scope.

Led the first version of the platform: architecture, cloud infrastructure, baseline DevOps, and delivery process.

Connected product goals, technical feasibility, and commercial constraints into a practical execution plan.

AI-native SDLC Advisor - Setronica

Remote | Feb 2026 - Present

Advising on controlled AI-assisted software delivery and specification-driven development.

Designed an AI-native delivery model with explicit task artifacts, context handling, agent roles, guardrails, validators, diff discipline, and traceability.

Helped shape adoption of AI-assisted development as a governed engineering workflow rather than uncontrolled tool usage.

Deputy CTO / Director of Engineering - Arameem / ToYou

Cyprus / Distributed | Oct 2018 - Aug 2025

Scaled and governed a high-load delivery/e-commerce platform and a distributed engineering organization.

Led a distributed technology organization of 200+ people across engineering, QA, DevOps, and product delivery.

Managed 14 team leads and functional heads, building leadership structure, delivery governance, and ownership clarity.

Scaled the platform from 3K to 300K DAU and from 100 to 100K+ delivery orders per day, with peaks of 130K.

Led parallel product/team contours, including the engineering team that built Leem, a public Saudi e-commerce product, alongside the core platform work.

Built and governed transactional architecture handling 1M+ financial transactions per day across payments, commissions, payouts, subscriptions, recurring payments, and BNPL.

Led production GenAI / LLM support automation with internal APIs, workflow integration, quality controls, and human escalation.

Introduced portfolio visibility, prioritization discipline, release governance, CI/CD quality gates, unit testing, and SonarQube-based quality controls.

Reduced critical production defects through systematic testing, ownership clarity, and delivery governance.

Cut cloud infrastructure costs by more than 50% while supporting business growth.

Restored delivery capability after sudden loss of an outsourcing partner and 30+ people across QA, ERP, and CRM; rebuilt the team in about 1.5 months and kept critical delivery running.

Earlier Leadership Experience

2010 - 2018 | Novosibirsk / Remote

CEO & Key Shareholder, Sobit: operated and stabilized a software company through commercial uncertainty; managed sales, finance, project portfolio, distributed teams, client communication, and delivery governance.

Director of IT Department, CDEK: modernized and stabilized a critical logistics platform after years of technical debt; improved performance by 50%+ and reduced outages through architecture and ownership changes.

Director of Software Development, CFT: led a 60+ engineering department delivering core-banking systems and enterprise implementations for major financial institutions; built a recurring support revenue model exceeding \$10M annually.

Selected Skills

Responsible AI, LLM orchestration, RAG and knowledge workflows, human-in-the-loop design, AI agents, AI-native SDLC, health-document workflows, OCR/document parsing, traceability, platform architecture, API integrations, privacy/security governance, CI/CD, quality gates, observability, cloud infrastructure, high-load systems, engineering leadership, stakeholder communication, product strategy, technical governance.

Technology

Python, FastAPI, Java, Spring Boot, PostgreSQL, Redis, SQLAlchemy, Pydantic, Celery, Docker, Kubernetes, AWS, GitLab CI/CD, SonarQube, OpenAI API, local/open models, OCR/document-processing pipelines, RAG/knowledge-base workflows.

Education

BSc in Physics, Novosibirsk State University, 1994-1999

Languages

English - C1

Russian - Native
